

Gemini Video Analyzer - User Manual

This is the guide for the current release. The application records or opens a video, chooses scene candidates locally, and uses Gemini to create a transcript and text-based scene analysis report.

【重要】 This is not a fully local workflow. The original video stays on your PC, but the selected scene-candidate images and audio are sent to the Gemini API after you confirm the upload.

1. One-time setup

You need Windows 10/11, Python 3.10 or later, and a Gemini API key. API availability, quotas, and charges depend on your Google account and plan.

1. Download the ZIP from GitHub Releases and extract it to a folder of your choice.
2. Open PowerShell in that folder and run:

```
py -3 -m pip install -r requirements-app.txt
```

3. Create a Gemini API key in Google AI Studio.
4. The first time you launch Start.bat, enter the key when prompted. Never share your key with anyone else.

【注記】 If the py command is not found, install Python 3.10 or later, enable “Add Python to PATH” in the installer, and try again.

2. Everyday use

Double-click Start.bat and select an item from the menu.

Number	Action
1	Record and create an AI analysis PDF
2	Analyze a saved video and create an AI analysis PDF
3	Resume an interrupted high-accuracy analysis
4	Use the legacy audio-only transcription workflow

You can also drag a video file onto Start.bat to start high-accuracy analysis of that video.

Record and analyze

1. Select 1 from the menu.
2. Choose the whole desktop, one monitor, or a mouse-selected area.
3. Press Enter to start recording, then press Enter again to stop.
4. The app prepares scene candidates and audio locally, then displays a confirmation before anything is sent to Gemini.

Before recording, make sure notifications, private chats, passwords, and other sensitive information are not visible in the chosen area. Obtain any necessary consent before recording a meeting.

Analyze a saved video

1. Select 2, or drag the video onto Start.bat.
2. Choose the video and review the upload confirmation.
3. Wait for completion. If processing stops, use item 3 on the next launch to resume it.

3. What is sent to Gemini

- The complete original video is never uploaded to Gemini.
 - The app sends locally selected scene-candidate images and audio for transcription after confirmation.
 - Gemini 3.5 Flash is the default. If it is rate-limited or busy, the app automatically falls back to Gemini 2.5 Flash and then Gemini 3.1 Flash-Lite.
 - Original video, extracted images, audio, and analysis results remain on your PC. Delete them yourself when they are no longer needed.
-

4. Output files

For recordings, files are saved under output/local_recordings/録画_datetime/. For a saved video, the app creates video-name_解析結果_datetime/ next to the source video.

File or folder	Purpose
画面録画.mp4 or 画面録画.avi	Original video captured by the recording mode
PC音声.wav or 解析用音声.wav	Audio used for transcription
抽出シーン/	Scene-candidate images chosen locally
文字起こし.txt	Full Gemini transcript
title_解析レポート.pdf	PDF containing scene timestamps, importance, descriptions, detected text, and the transcript
title_解析レポート.md	Editable Markdown report
画像解析結果.json	JSON scene-analysis data for use with other AI tools or software

The PDF does not embed the scene images. It contains their timestamps, importance, analysis results, and important detected text in a readable report.

5. Resume interrupted work

If a rate limit, network error, or app close interrupts processing, completed scene extraction, transcription, and image analysis are saved automatically.

1. Open Start.bat.
2. Select 3.
3. Choose the video analysis to resume.

Completed work is reused, so you do not need to start from the beginning.

6. Troubleshooting

“No module named ...”

Run the one-time setup command in the extracted folder:

```
py -3 -m pip install -r requirements-app.txt
```

API key is not configured

Launch Start.bat and paste your own Gemini API key when prompted. If you accidentally expose a key, revoke it in Google AI Studio and create a new one.

Analysis stops partway through

Check your network and Gemini quota, then resume from menu item 3. If rate limits continue after the automatic model fallback, wait and try again later.

PC audio cannot be recorded

In Windows Sound settings, confirm that your active speakers or headphones are selected. If you have just changed Bluetooth devices, close the app and open it again.

7. Sharing the app

You can share the folder as a ZIP. Before you do, delete recordings, audio, and reports from output, and exclude .env if it exists. Each user must create and enter their own Gemini API key.
